

# Transitional Care HF Clinic: How Do We Deal with the HF Discharged Patients

Sonja D. Brune, MSN, APRN, CCNS, CHFN, AACC  
Specialist  
UT Medicine Department of Medicine / Division of Cardiology  
Heart Failure Program

2

## Background

- 5.8 million Americans are living with heart failure (HF)
  - Projections estimate this to increase to 8 million by 2030
  - Total direct and indirect costs will exceed \$70 billion by 2030
- In spite of medical and technological advances, approximately half of Americans die within 5 years of HF diagnosis
- Over 1 million people are hospitalized with heart failure each year
- Approximately 25% (~ 250,000) are readmitted within 30 days
- 80% of HF hospital admissions present through the emergency department (ED)

JACC 2020; 8: 2-11

3

## Timeline of Hospital Readmissions Reduction Program (HRRP)

2007 MedPAC advised Congress on Medicare re: HF readmissions	2009 CMS began public reporting of readmission rates on Hospital Compare	2010 HRRP created under ACA to decrease hospital readmissions	2012 Penalty phase of HRRP began	2013 Modified to include only unplanned readmissions	2019 CMS includes risk stratification by proportion of Medicaid patients
---	---	--	-------------------------------------	---	---

JACC 2020; 8: 2-11

4

## Is the program effective?

Readmission rates have decreased by 0.5% per year

Raising awareness	Unfairly penalizes hospitals for issues beyond their control
Institutional investment in mechanisms to better assist patients during discharge and transitions	Incentivizes readmission avoidance over patient survival
Percent of hospital penalized has risen from 64% in 2013 to 79% in 2018	Encourages "gaming" the system
Medicare savings through penalties was \$290M in 2013, \$428M in 2015, and \$564M in 2018	Punitive measures unlikely to produce process improvements
	Recent evaluation of outcomes in Canada revealed no change in readmission rates but decline in mortality

JACC 2020; 8: 2-11

5

## Is the program equitable?

Readmission penalties >> Mortality metrics	Socioeconomic disadvantaged may be suffering more
Hospitals with higher readmission rates tend to have lower mortality	HRRP disproportionately penalized safety-net hospitals that serve greater proportions of socioeconomically disadvantaged populations
Patients presenting for potential readmission may be discharged, leading to higher rates of death	Fewer resources Lower baseline health status Greater health care use rate
GWTC-HF registry correlates increased 30-day and 1-year mortality with implementation of HRRP	Greater functional limitations Cognitive impairment Reduced health literacy
Medicare savings through penalties was \$290M in 2013, \$428M in 2015, and \$564M in 2018	Poor medical compliance Limited transportation resources Unstable housing

JACC 2020; 8: 2-11

6

## So.... Who is to blame???

7

The Hospital?

8

### Institutional factors

- Safety-net hospitals serve greater proportions of socioeconomically disadvantaged patient populations
- Many emergency departments continue to be overwhelmed by patients seeking care that should be managed in the clinic setting
- HRRP relies on administrative claims → risk adjustment algorithms may not be capable of appropriately accounting for hospital differences in sickness intensity and complexity or may be mischaracterized
- Failure to recognize worsening clinical status prior to discharge from the hospital
- Failure to identify or address comorbid conditions (underlying depression, anemia, hypothyroidism, etc.)
- Failure to optimize medication doses prospectively

9

The Patient?

10

### What we see in the hospital

Non-compliant patient

Doesn't know how she's going to pay rent

Doesn't feel safe in her relationship

Doesn't get paid time off from work to attend doctor's appointments

Doesn't own a vehicle

Food insecurity

Adverse childhood experiences

Cognitive impairment

### What's really going on

11

### How to Reduce HF Readmissions

*First step is to admit that you have a problem...  
(Clearly, "usual care" has it's shortcomings)*

12

### "Usual Care" in HF Fails To

- Prescribe evidence-based, guideline-derived medications
- Discontinue medications that may exacerbate HF
- Titrate medications to target doses
- Adequately address comorbidities
- Consider device therapy
- Make referrals for advanced HF therapies
- Coordinate care with hospice/palliative care
- Provide dietary counseling
- Provide adequate discharge planning
- Provide adequate follow-up and monitoring
- Address patient and caregiver needs
- Answer patient/caregiver questions in simple, understandable terms
- Help patients seek assistance with medication costs
- Consider lowest cost evidence-based medications
- Counsel patients about activity and sex

HFM: From Planning to Implementation 1st Ed 2014

13

### 10 Principles for Successful Treatment of Heart Failure

How to implement GDMT...	How to address challenges with...	How to manage...
<b>I. Initiate &amp; Switch</b> Treatment algorithms for guideline-directed medical therapy including novel therapies (Figure 2 and 3)	<b>III. Referral</b> Triggers for referral to HF specialist (Table 6)	<b>VIII. Increasing Complexity</b> Ten pathophysiologic targets in HF and treatments (Table 13)
<b>II. Titration</b> Target doses of select guideline-directed heart failure therapy (Tables 1, 2, 3, 4, 5) Considerations for monitoring	<b>IV. Care Coordination</b> Essential skills for a HF team (Table 7) Infrastructure for team-based HF care (Table 8)	<b>IX. Comorbidities</b> Common cardiac and non-cardiac comorbidities with suggested actions (Table 16)
	<b>V. Adherence</b> Causes of non-adherence (Table 9) Interventions for adherence (Table 10, 11)	<b>X. Palliative/Respite Care</b> Seven principles and actions to consider regarding palliative care
	<b>VI. Specific Patient Cohorts</b> Evidence based recommendations and assessment of risk for special cohorts: African American; older adults; frail (Table 12)	
	<b>VII. Cost of Care</b> Strategies to reduce cost (Table 15) Helpful information for completion of prior authorization forms (Table 14)	

14

### It's not all about the post-discharge follow up...

- Failure to decongest
- Failure to identify comorbid conditions
- Lack of understanding of patient's physical and cognitive status
- Polypharmacy
  - Inadequate medication reconciliation
  - Failure to optimize medication doses prospectively
  - Failure to discontinue known HF-exacerbating medication regimens
- Various socioeconomic factors
- Lack of communication resulting in primary care provider not knowing patient admitted
- Lack of advance care planning

15

### Getting Started

- Institutional needs assessment
  - Designate stakeholders/"champions" for core team
  - Review current metrics
  - Identify resource allocation (budget, staff, equipment, clinical space, etc)
  - Identify all providers anticipated to be involved in patient care (ED providers, hospitalists, etc)
  - Identify all cardiology providers anticipated to be involved in patient care
- Patient needs assessment
  - Extensive chart review of HF readmissions over predetermined period of time (ie: last 3 or 6 months)
    - Identify major factors contributing to readmissions for your patient population

16

### Program Implementation

- Business Plan
- Data Collection and Monitoring
- Operational Plan
- Program Scope
- Services Provided
- Building the Team
- Facilities
- Workflow

17

### Strategizing

- Prediction models
  - ADHERE Algorithm - predicts in-hospital mortality in ADHF
  - EHMRG Score - predicts mortality of emergency CHF patients
  - GWTG-HF Risk Score - predicts in-hospital HF mortality
  - LACE Score - predicts 30-day readmission or death
  - MAGGIC Risk Calculator for HF - estimates 1- and 3-year HF mortality
- Unit based interventions
  - Emergency department
  - Observation units
  - Inpatient units

18

### Inpatient Interventions

- Patient education
- Medication reconciliation
- Discharge planning

19

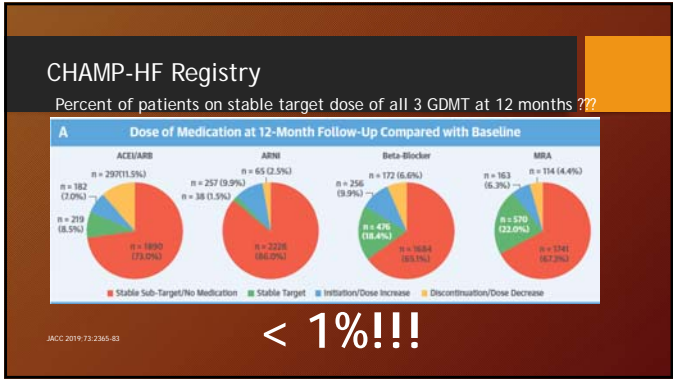

20

### Outpatient Interventions

- Transition of Care
  - Follow up phone call (by nurse navigator who saw patient in hospital)
  - Follow up phone call (by pharmacist who performed medication reconciliation)
  - Scheduled clinic visit in Heart Failure Disease Management Program within one week of discharge
  - Telemanagement
  - Device remote follow-up
  - Palliative and hospice care
